#### Abstract

An economy with two dates is considered, one state at the ${ }^{-}$rst date and a - nite number of states at the last date. Shareholders determine production plans by voting \{ one share, one vote \{ and at $1 / 2 m$ majority stable equilibria, alternative production plans are supported by at most $1 / 2 \mathcal{L} 100$ percent of the shareholders. It is shown that a $1 / 2$ majority stable equilibrium exists provided that $$
1 / 2, \quad \min ^{1 / 2} \frac{S i J}{S i J+1} ; \frac{B^{3 / 4}}{B+1}
$$ where $S$ is the number of states at the last date, $J$ is the number of ${ }^{-} r m s$ and $B$ is the dimensions of the sets of $e \pm$ cient production plans for ${ }^{-} r m s$. Moreover, an example shows that $1 / 2$ majority stable equilibria need not exist for smaller $1 / 2 \mathrm{~s}$.

## 1 Introduction

If markets are complete then consumers have common shadow prices \{ name ly the vector of market prices. So shareholders agree that ${ }^{-}$rms should maximize pro- ts with respect to these common prices. However, if markets are incomplete, shadow prices need not be common. Thus, typically shareholders disagree on the production plans to be chosen. Therefore several suggestions have been put forward as reasonable objectives for ${ }^{-}$rms.

It seems nat ural that production plans should satisfy the Pareto criterion: there are no alternative production plans that make some shareholders better $0 ®$ and none worse $O$ © . Unfortunately, the Pareto criterion is weak: production plans satisfy the Pareto criterion if and only if they maximize pro- ts with respect to some price vector in the convex hull of the shareholders' shadow prices.

Draze (1974) and Grossman \& Hart (1979) agree that production plans should satisfy the Pareto criterion and propose that sidepayments between shareholders be allowed. Dreze (1974) (resp. Grossman \& Hart (1979)) suggests that production plans should re ect preferences of ${ }^{-}$nal (resp. initial) shareholders: this may be interpreted as production plans are determined after markets close (resp. before markets open). However, sidepayments depend on information that shareholders have incentives to manipulate, a weakness that voting rules overcome.

Draze (1985) suggests that production plans should be stable for simple majority vot ing between shareholders and unanimity between board members (without sidepayments): there is no alternative production plan that makes all board members as well as a majority of shareholdersbetter o®. As in Draze (1974) production plans re ${ }^{\circ}$ ect preferences of ${ }^{-}$nal shareholders. It appears to be a drawback that unanimity between board members is essential for existence of equilibria.

DeMarzo (1993) investigates some properties of equilibria where production plans are stable for simple majority voting between shareholders. Typi-
cally the largest shareholder determines the production plan at these equilibria. Also, DeMarzo shows that stability for simple majority voting between shareholders and unanimity between board members imply that board members determine the production plan. However, as he argues, such equilibria need not exist unless either the degree of market incompleteness or the dimension of the set of e $\pm$ cient production plans is 1 .

In the present paper, stability with respect to $1 / 2 m a j o r i t y ~ v o t i n g ~ b e t w e e n ~$ shareholders is studied: there is no alternative production plan that makes more than $1 / 2 \mathcal{L} 100$ percent of the shareholders better 0 ® . Indeed, at a $1 / 2$ majority stable equilibrium (or $1 / 2 \mathrm{MSE}$ ), consumers do not want to change their portfolios, ${ }^{-}$rms are not able to make more than $1 / £ 100$ percent of their shareholders better $O^{\circledR}$ by changing production plans and ${ }^{-}$nally, markets clear. It is shown that if portfolios are unbounded then a $1 / 2 \mathrm{MSE}$ exists provided that

$$
1 / 2, \quad \min ^{1 / 2} \frac{S i J}{S i J+1} ; \frac{B^{3 / 4}}{B+1}
$$

where $S$ is the number of states at the last date, $J$ is the number of ${ }^{-} r m s$ and $B$ is the dimension of the set of $e \pm$ cient production plans for ${ }^{-}$rms. If portfolios are bounded to be non-negative then a $1 / 2 \mathrm{MSE}$ exists provided that $1 / 2, \quad B=(B+1)$.

Di®erent timings of trade and vote are considered. Voting may take place while markets are open or after markets close, in which case ${ }^{-}$nal shareholders vote (as in Drpze (1985) and DeMarzo (1993)). And it may take place before markets open, in which case initial shareholders vote. In case of voting before markets open or while they are open, shareholders need to form expectations about price variations. Two types of price perceptions are considered: competitive price perceptions (as introduced by Grossman \& Hart (1979)) and ${ }^{-}$xed price perceptions. According to competitive price perceptions consumers perceive that income vectors are valued by their shadow prices; whereas according to ${ }^{-}$xed price perceptions they perceive that prices are not $\mathrm{in}^{\circ}$ uenced by changes in production plans.

In general, changes of production plans in ${ }^{\circ}$ uence trading opportunities through two channels: they change the value of portfolios as well as the span of assets. From this perspective, competitive price perceptions and ${ }^{-}$xed price perceptions represent two extremes: consumers concentrate on how changes of production plans change the value of their portfolios with the former and the span of assets with the latter.

In case markets are complete, a $1 / 2 \mathrm{MSE}$ exists even for unanimity, i.e. with $1 / 2=0$. Ekern \& Wilson (1974) have shown that this result extends to the case of partial spanning, i.e. the sets of e $\pm$ cient production plans are subsets of the span of assets ${ }^{1}$. In case markets are incomplete such that either the degree of incompleteness is 1 or the sets of e $\pm$ cient production plans are 1 -dimensional, a $1 / 2 \mathrm{MSE}$ exists for simple majority voting, i.e. with $1 / 2=1=2$, as argued by DeMarzo (1993). It is shown here that in case of a more severe degree of incompleteness and higher dimensions of the sets of e $\pm$ cient production plans, super majority rules ( $1 / 2>1=2$ ) are needed to ensure existence of $1 / 2 \mathrm{MSE}$.

The social choice literature oBers some general results on existence of stable equilibria under super majority voting \{ see, e.g., Ferejohn \& Grether (1974), Greenberg (1979), Caplin \& Nalebu® (1988, 1991) and Balasko \& Crps (1997). Crps (2000) exploits the results of Caplin \& Nalebu® (1988, 1991) to obtain some conditions on the distribution of consumers' characteristics under which a $1 / 2 \mathrm{MSE}$ exists for $1 / 2$ between 0.5 and 0.64 in a model with a continuum of consumers, restrictive assumptions on production sets and preferences of consumers. Here the result of Greenberg (1979) is exploited to obtain a lower bound on the rate $1 / 2$ for which a $1 / 2 \mathrm{MSE}$ exists, in a model with a- nite number of consumers, weak assumptions on productions sets and preferences, and no assumptions on the distribution of consumers' characteristics. A di $\pm$ culty in applying the results from the social choice

[^1]literature is that preferences of shareholders, as well as shares (i.e. voting weights), are endogeneously determined through general equilibrium eßects.

Even though the proposed bounds on $1 / 2$ are quite high and cannot be improved, as shown by an example, the results of the present paper show that: (1) the degree of market incompleteness plays a fundamental role in re stricting the dimension of the set of alternatives and thereby in aggregating preferences of shareholders and (2) the lower the degree of market incompleteness the lower super majority rate is necessary to ensure existence of a ½MSE.

The paper is organized as follows: in Section 2 the model is introduced; in Section 3 assumptions are stated, existence of a $1 / 2 \mathrm{MSE}$, for $1 / 2, \operatorname{minf}(\mathrm{~S} ;$ $J)=(S ; J+1) ; B=(B+1) g$, is established in case voting takes place after markets close, and an example is given showing that the latter bound cannot be improved; in Section 4 price perceptions are int roduced and existence of a $1 / 2 \mathrm{MSE}$ is established in case voting takes place either before markets open or while they are open, and; ${ }^{-}$nally Section 5 contains some concluding remarks. All proofs are gathered in an appendix.

## 2 The model

Consider an economy with 2 dates, $\mathrm{t} 2 \mathrm{f} 0 ; 1 \mathrm{~g}$, 1 state at the ${ }^{-}$rst date, $\mathrm{s}=0$, and S states at the second date, s $2 \mathrm{f} 1 ;::: ;$ Sg. There are: 1 commodity at every state, I consumers, i 2 f $1 ;::: ; 1 \mathrm{~g}$, and $\mathrm{J}^{-r m s}$, j 2 $\mathrm{f} 1 ;::: ; \mathrm{Jg}$. Consumers are characterized by their consumption sets, $X_{i} 1 / 2$ $R^{S+1}$, endowments, ! $2 R^{S+1}$, preferences described by correspondences, $P_{i}: X_{i}!X_{i}$, and initial portfolio of shares in ${ }^{-r m s}$, $\pm 2 R^{J}$ where $P_{i=1} t_{i j}=$ 1 for all j . Firms are characterized by their production sets, $Y_{j} 1 / 2 R^{\mathrm{S}+1}$.

Consumers choose consumption plans, $x_{i} 2 X_{i}$, and portfolios, $\mu_{i} 2 R^{J}$. Firms choose production plans, $y_{j} 2 Y_{j}$. For convenience, let $x=\left(x_{i}\right)_{i=1}^{!}$, $\mu=\left(\mu_{i}\right)_{i=1}^{!}, y=\left(y_{j}\right)_{j=1}^{J}, q=(q)_{j=1}^{J} 2 R^{J}$ where $q$ is the price of shares in

With some abuse of notation, $q$ denotes the price of shares $\mathrm{in}^{-} \mathrm{rm} j$ as well as the $j$ 'th column of $Q$. The budget set of consumer $i$ is

$$
B_{i}(Q ; Y)=f x_{i} 2 X_{i} j x_{i} \cdot!_{i}+Q_{A}+(Y ; Q) \mu_{i} \text { for some } \mu_{i} 2 R^{J} g
$$

and $x_{i}$ is a solution to the problem of consumer $i$ provided that $x_{i} 2 B_{i}(Q ; Y)$ and $P_{i}\left(x_{i}\right) \backslash B_{i}(Q ; Y)=;$. Hence, there are no strategic considerations involved in the choices of portfolios. Let $\mathrm{U}_{\mathrm{ij}}\left(\mathrm{x}_{\mathrm{i}} ; \mu_{\mathrm{ij}} ; \mathrm{y}_{\mathrm{j}}\right)$ denote the set of production plans for ${ }^{-}$rm $j$ that make, at the considered allocation ( $x ; \mu ; y$ ), consumer i better 0 ® i.e.

$$
U_{i j}\left(x_{i} ; \mu_{i j} ; y_{j}\right)=f y_{j}^{0} 2 Y_{j} j x_{i}+\left(y_{j}^{0} i y_{j}\right) \mu_{i j} 2 P_{i}\left(x_{i}\right) g:
$$

Next let $u_{j}\left(x ; \mu_{j} ; y_{j} ; y_{j}^{0}\right)$ denotethe set of consumerswho are, at the considered allocation $(x ; \mu ; y)$, better $0 ®$ with production plan $y_{j}^{0}$ for ${ }^{-}$rm j rather than $y_{j}$, i.e.

$$
u_{j}\left(x ; \mu_{j} ; y_{j} ; y_{j}^{0}\right)=\text { fi } 2 \text { f } 1 ;::: ; \text { I gjy } y_{j}^{0} 2 U_{i j}\left(x_{i} ; \mu_{i j} ; y_{j}\right) g:
$$

Then preferences of ${ }^{-}$rms are described, for $a^{-}$xed rate ${ }^{1 / 2}$ of the super majority rule, by correspondences, $P_{j}^{1 / 2}:{ }^{Q}{ }_{i} X_{i} £ R^{\prime} £ Y_{j}!Y_{j}$, de- ned by

And $y_{j}$ is a solution to the problem of ${ }^{-} r m j$ provided that $P_{j}^{1 / 2}\left(x ; \mu_{j} ; y_{j}\right) \backslash Y_{j}=$ ; . Thus, if the production plan is changed from $y_{j}$ to $y_{j}^{0}$ then this change is distributed to shareholders propotionally to their shares.

De ${ }^{-}$nition $1\left(q^{\text {a }} ; x^{\text {a }} ; \mu^{\mathrm{a}} ; y^{\mathrm{a}}\right)$ is a $1 / 2 m$ ajority stable equilibrium provided that
${ }^{2} x_{i}^{\text {a }} \cdot!_{i}+Q^{a} f_{i}+\left(Y^{a}{ }_{i} Q^{\text {a }}\right) \mu_{i}^{a}$ and $x_{i}^{a}$ is a solution to the problem of consumer i for ( $\left.\mathrm{q}^{\mathrm{a}} ; \mathrm{y}^{\mathrm{a}}\right)$, i.e.
for all i 2 l ,
${ }^{2} y_{j}^{a}$ is a solution to the problem of ${ }^{-} r m j$ for $\left(x^{a} ; \mu_{j}^{a}\right)$, i.e.

$$
y_{j}^{a} 2 Y_{j}^{a} \text { and } P_{j}^{1 / 2}\left(x^{a} ; \mu_{j}^{a} ; y_{j}^{a}\right) \backslash Y_{j}^{a}=;
$$

for all j 2 J , and,
2 markets clear, i.e.

$$
{ }_{i}^{x} x_{i}^{a}={ }_{i}^{x}!_{i}^{a}+{ }_{j}^{x} y_{j}^{a} \text { and }{ }_{i}^{x} \mu_{j j}^{a}=1
$$

for all j 2 J.

## 3 A ssumptions and existence of equilibrium

Assumptions on consumers, ${ }^{-} \mathrm{rms}$ and the production sector are imposed in order to ensure the existence of a $1 / 2 m$ majority stable equilibrium.

Consumers are supposed to satisfy the following assumptions
(a.1) $X_{i}=R^{S+1}$,
(a.2) $!_{i} 2 R^{S+1}$,
(a.3) $\mathrm{gr}_{\mathrm{i}}$ is open,
(a.4) $f x_{i} g+R_{+}^{S+1} n f 0 g 2 P_{i}\left(x_{i}\right)$,
(a.5) for all $x_{i}$, there exists a unique ${ }^{1}{ }_{i} 2 \Phi+$ such that ${ }^{1}{ }_{i} \Phi\left(x_{i}^{0} i X_{i}\right)>0$ for all $x_{i}^{0} 2 P_{i}\left(x_{i}\right)$ where $\Phi_{+}^{S}=f, 2 R_{+}^{S+1} j^{P}{ }_{s,}{ }^{s}=1 \mathrm{~g}$, and,
(a.6) if $A 1 / 2 R^{S+1}$ is compact then there exists $x_{i}(A) 2 R^{S+1}$ such that if $x_{i} 2 R^{S+1} n\left(f x_{i}(A) g+R_{+}^{S+1}\right)$ then $A 1 / 2 P_{i}\left(x_{i}\right)$.

Assumptions (a.1) and (a.2) imply that consumption sets are unbounded as considered by Balasko (1988) while assumptions (a.3), (a.4), (a.5) and (a.6) are generalizations of equivalent assumptions considered by Balasko (1988) to non-transitive, non-complete and non-di®erentiable preferences. Assumptions (a.3) and (a.4) are standard continuity and monotonicity assumptions; assumption (a.5) states existence of a unique shadow price vector ${ }^{1}{ }_{i}\left(x_{i}\right)$ at each consumption bundle $x_{i}$, and; assumption (a.6) generalizes the standard $\backslash$ boundedness from below" property of indißerence sets to the present framework where preferences are not necessarily transitive nor complete.

Let $Z_{j} 1 / 2 R^{S+1}$ be the set of e $\pm$ cient production plans, i.e.

$$
Z_{j}=f y_{j} 2 R^{S+1} j\left(f y_{j} g+R_{+}^{S+1}\right) \backslash Y_{j}=f y_{j} g g
$$

then ${ }^{-r m s}$ are supposed to satisfy the following assumptions
(a.7) the production set, $\mathrm{Y}_{\mathrm{j}}$, is convex and closed, and,
(a.8) there exists a compact and B-dimensional $a \pm$ ne set, $B_{j} 1 / 2 R^{S+1}$, such that $\mathrm{Z}_{\mathrm{j}}{ }^{1 / 2} \mathrm{~B}_{\mathrm{j}}$.

Assumption (a.7) is standard while assumption (a.8) includes \truncated" production sets such as
fy $2 R^{S+1} y^{0} 2[y ; 0]$ and $y^{s} \cdot\left(y^{0}\right)^{b}$ for all s $2 f 1 ;::: ; S g g$
where y . 0 and b2]0; 1].
Moreover, the production sect or of the economy is supposed to satisfy the following assumption
(a.9) production plans for date $1,\left(\left(y_{j}^{s}\right)_{s=1}^{S}\right)_{j=1}^{J}$, are linearly independent for all production plans in the convex hull of the closure of the set of et cient production plans, $y_{j} 2 \mathrm{cocl} Z_{j}$ for all $j$.

Assumption (a.9) excludes that ${ }^{-} \mathrm{rms}$ are able to replicate production plans of each other.

Theorem 1 There exists a $1 / 2 m$ majority stable equilibrium for all economies which satisfy assumptions (a.1) to (a.9) if and and only if

$$
1 / 2, \quad \min ^{1 / 2} \frac{S_{i} J}{S_{i} J+1} ; \frac{B}{B+1}^{3 / 4}:
$$

Remark: The argument to establish the $\backslash$ if" of the assertion is based on the proofs of Theorem 2 in Greenberg (1979) and the theorem in Shafer \& Sonnenschein (1975). A generalized game is constructed where, among other constructions, ${ }^{-}$rms determine production plans that maximize pro ts with respect to prices which re ${ }^{\circ}$ ect interests of their shareholders and groups of shareholders (one per ${ }^{-} r m$ ) determine pricesfor which ${ }^{-}$rms maximize pro ${ }^{-}$ts. Hence, the original problem of the ${ }^{-r m}\left\{\right.$ which is to ${ }^{-}$nd a production plan for which no alternative production plan can be supported by a $1 / 2 m$ mojority of its shareholders \{ is decomposed into pro $^{-} \mathrm{t}$ maximization with respect to ${ }^{-} \mathrm{rm}$ speci ${ }^{-}$c prices and determination of ${ }^{-} \mathrm{rm}$ speci ${ }^{-}$c prices with respect to some arti- cial preferences for its shareholders.

The argument to establish the \only if" of the assertion is based on the construction of an economy for which no $1 / 2 m$ majority stable equilibrium with $1 / 2<\operatorname{minf}(S ; J)=(S ; J+1) ; B=(B+1) g$ exists.

## End of remark

In case $S_{i} J=1$, Theorem 1 ensures existence of a simple majority stable equilibrium. It is easily seen that the prices for which ${ }^{-}$rms maximize pro ${ }^{-}$ts are, in this case, typically not the ones Dreze (1974) suggests. Indeed, in theorem 1 the shadow price vect or of the median shareholder is used whereas Draze (1974) suggests that the average shadow price vector should be used.

Trading on the ${ }^{-}$nancial markets, when consumers are not constrained in their portfolio choices, leads to suitable normalized shadow prices being
 if there are restrictions on portfolios, like short sales constraints, then the degree of market incompleteness need not restrict shadow prices.

Corollary 1 Suppose that portfolios are bounded such that $\mu_{i} 2[0 ; 1]^{J}$ for all $i$ and that $\mathrm{cocl} Z_{j} 1 / 2 R_{+}^{S+1}$ for all j . Then there exists a $1 / 2$ majority stable equilibrium provided that

$$
1 / 2, \quad \frac{B}{B+1}:
$$

It is hard to love the assumption that $\operatorname{cocl} \mathrm{Z}_{\mathrm{j}} 1 / 2 \mathrm{R}_{+}^{\mathrm{S}+1}$ for all j . However, the \Cass-trick" \{ one consumer trades on complete markets \{ cannot be applied in corollary 1 because portfolios are bounded to be between 0 and 1. Therefore existence of equilibrium is only ensured provided that prices of shares are positive as explained by Radner (1972) and the assumption ensures this.

## 4 Price perceptions

In the present section di®erent timings between trade and vote eare considered. At a $1 / 2 m$ majority stable equilibrium, ( $q^{\mathrm{a}} ; \mathrm{x}^{\mathrm{a}} ; \mu^{\mathrm{a}} ; \mathrm{y}^{\mathrm{a}}$ ), if consumer i considershow to vote with regard to a changefrom ( $\left.q^{\mathrm{a}} ; \mathrm{y}_{j}^{\mathrm{a}}\right)$ to $\left(\mathrm{q}_{;} ; \mathrm{y}_{j}\right)$ of price and production plan for ${ }^{-} \mathrm{rm} \mathrm{j}$ (where $\pm_{\mathrm{ij}}>0$ or $\mu_{\mathrm{ij}}^{\mathrm{a}}>0$ because otherwise consumer i have no voting weight) then

2 in case voting takes place after markets close, she votes for the change if and only if

$$
x_{i}^{a}+\left(Y^{\square} j y_{j} i Y^{a}\right) \mu_{i}^{a} 2 P_{i}\left(x_{i}^{a}\right)
$$

where $Y^{\square}{ }^{\mathrm{j}} \mathrm{y}_{\mathrm{j}}$ is $\mathrm{Y}^{\mathrm{a}}$ with $\mathrm{y}_{\mathrm{j}}$ replacing $\mathrm{y}_{\mathrm{j}}^{\mathrm{a}}$,

2 in case voting takes place while markets are open, she votes for the change if and only if

$$
x_{i}^{\mathrm{a}} i\left(Y^{\mathrm{a}} i Q^{\mathrm{a} j q}\right) \mu_{i}^{\mathrm{a}}+\left(Y^{\mathrm{a} j y_{j}} ; Q^{\mathrm{a}} j q\right) \mu_{i} 2 P_{i}\left(x_{i}^{a}\right)
$$

for some $\mu_{i}$, and,
${ }^{2}$ in case voting takes place before markets open, she votes for the change if and only if
for some $\mu_{i}$ (here the voting weights are $\ddagger_{j}^{+}$).
If portfolios are unbounded, i.e. $\mu_{i} 2 R^{J}$, then ${ }^{1}{ }_{i}\left(x_{i}\right) 2 \mathrm{hY}^{\mathrm{a}} \mathrm{i} \mathrm{Q}^{\mathrm{a}} \mathrm{i}$ ? at a $1 / 2 m a j o r i t y ~ s t a b l e ~ e q u i l i b r i u m, ~\left(q^{\mathrm{a}} ; x^{\mathrm{a}} ; \mu^{\mathrm{a}} ; \mathrm{y}^{\mathrm{p}}\right)$. Therefore in case voting takes place after markets close (resp. while markets are open or before they open), if consumer $i$ votes for the change then ${ }^{1}{ }_{i}\left(x_{i}^{p}\right) ~ \Phi\left(y_{j} i y_{j}^{\text {r }}\right)>0\left(\right.$ resp. ${ }^{1}{ }_{i}\left(x_{i}^{p}\right) \Phi$ $\left(q i q^{\text {a }}\right)>0$ or $\left.{ }^{1}{ }_{i}\left(x_{i}^{\text {r }}\right) \phi\left(y_{j} i q\right) 60\right)$. Thus, equivalently, in case voting takes place after markets close (resp. while markets are open or before they open),
 then consumer i votes against the change. However, consumers do not know how prices depend on production plans so if voting takes place before or while markets are open then they need to form perceptions about this.

### 4.1 Competitive price perceptions

Grossman \& Hart (1979) introduced the notion of competitive price perceptions in a model where production plans are determined by shareholders be fore markets open. Consider a 1 ²majority stable equilibrium, ( $\left.q^{\mathrm{n}} ; \mathrm{x}^{\mathrm{n}} ; \mu^{\mathrm{a}} ; \mathrm{y}^{\mathrm{a}}\right)$, then a change of production plan from $y_{j}^{a}$ to $y_{j}$ for ${ }^{-} r m j$ is perceived by consumer i to change the price from $q^{\mathrm{a}}$ to

$$
q_{j}\left(x_{i}^{\mathrm{a}} ; y_{j}\right)={\frac{1}{1_{i}^{0}\left(x_{i}^{\text {a }}\right.}}^{1}{ }_{i}\left(x_{i}^{\mathrm{a}}\right) \phi y_{j}:
$$

Consequently, if consumer i votes for the change and has competitive price perception then ${ }^{1}{ }_{i}\left(x_{i}^{\text {a }}\right) \Phi\left(y_{j} \mathrm{i} y_{j}^{\mathrm{a}}\right)>0$ and, equivalently, if ${ }^{1}\left(\mathrm{x}_{\mathrm{i}}^{\mathrm{R}}\right) \Phi\left(\mathrm{y}_{\mathrm{j}} \mathrm{i}\right.$ $\left.y_{j}^{\mathrm{a}}\right) \cdot 0$ then consumer i votes against the change. This does not depend on whether voting takes place before markets open, while they are open or after they close. Informally, if consumers have competitive price perceptions then they concentrate on how changes of production plans change values of their portfolios rather than the span of assets.

Thus, there is a diBerent interpretation of the model of Section 2 as well as the results of Section 3: voting takes place while markets are open and consumers have competitive price perceptions. Moreover, Theorem 1 and Corollary 1 extend to the model with voting before markets open provided that consumers have competitive price perceptions. However in this latter case the set of equilibria is typically not identical to the set of equilibria of the former case because voting weights typically are not identical, i.e. $\mu_{i}^{a} 6 \ddagger$. Hence, the next corollary follows from the proof of Theorem 1 with only minor modi- cations.

Corollary 2 Suppose that voting takes place before markets open, while they are open or after they close and that consumers have competitive price perceptions. Then there exists a $1 / 2 m$ jority stable equilibrium provided that

$$
1 / 2, \quad \min ^{1 / 2} \frac{S_{i} J}{S_{i} J+1} ; \frac{B}{B+1}^{3 / 4}:
$$

### 4.2 Fixed price perceptions

Consider a $1 / 2$ majority stable equilibrium, $\left(q^{\mathrm{a}} ; x^{\mathrm{a}} ; \mu^{\mathrm{a}} ; \mathrm{y}^{\mathrm{a}}\right)$, then a change of production plan from $y_{j}^{a}$ to $y_{j}$ for ${ }^{-} r m j$ is perceived by consumer i not to change the price, $q^{\text {a }}$. Informally, if consumers have ${ }^{-}$xed price perceptions then they concentrate on how changes of production plans change the span of assets rather than values of portfolios.

Portfolios are bounded between 0 and 1, i.e. $\mu_{i} 2[0 ; 1]^{\mathrm{J}}$, so the modi- ed
budget set of consumer i is

$$
B_{i}(Q ; Y)=f x_{i} 2 X_{i j} x_{i} \cdot!_{i}+Q_{A}+(Y i Q) \mu_{i} \text { for some } \mu_{i} 2[0 ; 1]^{J} g:
$$

Let

$$
\begin{aligned}
\mho_{i j}\left(q ; x_{i} ; y\right)= & f y_{j}^{0} 2 Y_{j} j x_{i}+\left(Y j y_{j}^{0} i Q\right) \mu_{i} 2 P_{i}\left(x_{i}\right) \\
& \text { for some } \mu_{i} 2[0 ; 1]^{J} g \\
\mathrm{u}_{\mathrm{j}}\left(\mathrm{q} ; \mathrm{x} ; \mathrm{y} ; \mathrm{y}_{\mathrm{j}}^{0}\right)= & \text { fi } 2 \mathrm{f} 1 ;::: ; \mathrm{l} \mathrm{gj} \mathrm{y}_{\mathrm{j}}^{0} 2 \cup_{\mathrm{ij}}\left(\mathrm{q} ; \mathrm{x}_{\mathrm{i}} ; \mathrm{y}_{\mathrm{j}}\right) \mathrm{g}
\end{aligned}
$$

then preferences of ${ }^{-} r m s$ are described by correspondences, $P_{j}^{1 / 2}: R^{J} £^{Q}{ }_{i} X_{i} £$ $[0 ; 1]^{l} £^{Q}{ }_{j} Y_{j}!Y_{j}$, de- ned by

in case voting takes place while markets are open and $\ddagger$ replaces $\mu_{j}$ in case voting takes place before markets open.

Corollary 3 Suppose that portfolios are bounded such that $\mu_{i} 2[0 ; 1]^{J}$ for all i , that $\infty \mathrm{cl}_{\mathrm{j}}{ }^{1 / 2} \mathrm{R}_{+}^{S_{+} 1}$ for all j and that consumers have ${ }^{-}$xed price perceptions. Then a $1 / 2 m$ majority stable equilibrium exists provided that

$$
1 / 2, \quad \frac{B}{B+1}:
$$

## 5 Final remarks

In the present paper, bounds on $1 / 2$ are provided such that $1 / 2$ majority stable equilibria exist. To complement these results on existence of equilibrium it would be nice study: (1) the e $\pm$ ciency properties of equilibrium allocations, and; (2) the \size" of the set of equilibria.

On the one hand, in many countries, simple majority voting is used in assemblies of shareholders. On the other hand, the provided bounds on $1 / 2$ implies that simple majority stable equilibria need not exist unless either the degree of incompleteness is 1 or the sets of e $\pm$ cient production plans are 1-dimensional. Therefore it would be interesting to ${ }^{-}$nd $\backslash$ reasonable" assumptions on production sets and preferences of consumers that ensure exist ence of $1 / 2$ majority stable equilibria for lower values of $1 / 2$

## Appendix

## Proof of Theorem 1

In part 1 , resp. part 2 , it is shown that if $1 / 2,(S ; J)=(S ; J+1)$, resp. $1 / 2, B=(B+1)$, then a $1 / 2$ majority stable equilibrium exists. In part 3 , an example is provided of an economy for which no $1 / 2$ majority stable equilibrium with $1 / 2<\operatorname{minf}(S ; J)=(S ; J+1) ; B=(B+1) g$ exists.

Part $1: 1 / 2, \quad(S ; J)=(S ; J+1)$
The variables to be determined are state prices,, $2 \Phi_{+}^{S}$, consumption bundles for consumers, $x=\left(x_{i}\right)_{i=1}^{!}{ }^{1 / 2} Q_{i=1} X_{i}$, production plans for ${ }^{-} r m s$, $y=\left(y_{j}\right)_{j=1}^{J} 1_{2}^{1 / 2} Q_{j=1} Y_{j}$, and prices with respect to which - rms maximize pro ${ }^{-}$ts, ${ }^{\circ}=\left({ }^{\circ}{ }_{j}\right)_{j=1}^{J} 2{ }^{Q_{j=1}} \Phi_{+}^{S}$.

The auctioneer (agent 0) determines state prices in order to maximize the value of excess demand. Consumers (agent k $2 \mathrm{f} 1 ;::: ; \mathrm{l}$ g) determine maximal consumption bundles for their preferences. Firms (agent k $2 \mathrm{fl}+$ $1 ;::: ; I+J g$ ) determine production plans that maximize pro ${ }^{-}$ts with respect to prices which re ect interests of their shareholders. Groups of shareholders (agent $\mathrm{k} 2 \mathrm{fl}+\mathrm{J}+1 ;::: ; \mathrm{l}+2 \mathrm{Jg}$, one group per ${ }^{-} \mathrm{rm}$ ) determine prices for which ${ }^{-}$rms maximize pro ts. Hence, the original problem of the ${ }^{-}$rm \{ which is to ${ }^{-}$nd a production plan for which no alternative production can be supported by a $1 / 2 m$ ajority of its shareholders \{ is decomposed into pro ${ }^{-} t$ maximization with respect to ${ }^{-} \mathrm{rm}$ speci- c prices and determination of ${ }^{-} \mathrm{rm}$ speci ${ }^{-}$c prices with respect to some arti- cial preferences for its shareholders.

In a ${ }^{-}$rst step, these four categories of agents (auctioneer, consumers, - rms and groups of shareholders) are described. In a second step, a suitable correspondence is constructed and Kakutani's ${ }^{-}$xed point theorem is applied. Finally, in a third step, the ${ }^{-}$xed point is shown to be a $1 / 2$ majority stable equilibrium.

Step 1: description of agents
$\backslash$ Auctioner" For agent $k=0$, the strategy set, $\mathrm{V}_{k} 1 / 2 R^{\mathrm{S}+1}$, is de ned by

$$
V_{k}=\Phi_{+}^{S} \backslash\left[\frac{1}{n} ; 1\right]^{S+1}
$$

where n 2 N , the constraint correspondence, $\mathrm{C}_{\mathrm{k}}: \mathrm{V}$ ! $\mathrm{V}_{\mathrm{k}}$ (where V is the product of the agents' strategy sets, to be de- ned in the sequel), is de- ned by

$$
C_{k}(; ; x ; y ; \underline{o})=V_{k}
$$

and the preference correspondence, $\mathrm{Q}_{\mathrm{k}}: \mathrm{V}!\mathrm{V}_{\mathrm{k}}$, is de ${ }^{-}$ned by

Clearly, $\mathrm{V}_{\mathrm{k}}$ is compact and convex, $\mathrm{C}_{\mathrm{k}}$ is continuous and $\mathrm{gr} \mathrm{Q}_{\mathrm{k}}$ is open with , $\underset{\operatorname{Z}}{\cos } \mathrm{Q}_{\mathrm{k}}\left(, ; \mathrm{x} ; \mathrm{y} ;{ }^{\circ}\right)$.
\Consumers" For agent k $2 \mathrm{f} 1 ;::: ;$ I g, the strategy set, $\mathrm{V}_{\mathrm{k}} 1 / 2 \mathrm{X}_{\mathrm{i}}$ where $\mathrm{i}=\mathrm{k}$, is de ned by

$$
V_{k}=X_{i} \backslash\left(f!i g+{ }_{j}^{X} \ddagger_{j} \operatorname{cocl} Z_{j}+[i n ; n]^{S+1}\right)
$$

where n 2 N , the constraint correspondence, $\mathrm{C}_{\mathrm{k}}: \mathrm{V}$ ! $\mathrm{V}_{\mathrm{k}}$, is de ned by

$$
C_{k}(, ; x ; y ; \underline{o})=f x_{i}^{0} 2 V_{k} j_{,} \Phi\left(x_{i}^{0} i!_{i} i Q_{i}\right) \cdot 0 g
$$

for $\mathrm{k}=1$ where $\mathrm{q}=\left(1=,{ }^{0}\right), \phi \mathrm{y}_{\mathrm{j}}$ for all j and

$$
\mathrm{C}_{\mathrm{k}}(. ; \mathrm{x} ; \mathrm{y} ; \underline{\circ})=\mathrm{B}_{\mathrm{i}}(\mathrm{Y} ; \mathrm{Q}) \backslash \mathrm{V}_{\mathrm{k}}
$$

for $\mathrm{k} 2 \mathrm{f} 2 ;::: ;$ I g and the preference correspondence, $\mathrm{Q}_{\mathrm{k}}: \mathrm{V}!\mathrm{V}_{\mathrm{k}}$, is de ${ }^{-}$ned by

$$
\mathrm{Q}_{\mathrm{k}}(; ; \mathrm{x} ; \mathrm{y} ; \underline{o})=\operatorname{co} \mathrm{P}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}\right) \backslash \mathrm{V}_{\mathrm{k}}:
$$

Clearly, $\mathrm{V}_{\mathrm{k}}$ is compact and convex, $\mathrm{C}_{\mathrm{k}}$ is continuous and $\mathrm{gr} \mathrm{Q}_{\mathrm{k}}$ is open with $x_{i} \nsupseteq \operatorname{co} Q_{k}\left(, ; x ; y ;{ }^{\circ}\right)$ for $i=k$.
$\backslash$ Firms" For agent $\mathrm{k} 2 \mathrm{fI}+1 ;::: ; \mathrm{l}+\mathrm{Jg}$, the strategy set, $\mathrm{V}_{\mathrm{k}} 1 / 2 \mathrm{Y}_{\mathrm{j}}$, is de- ned by

$$
V_{k}=\operatorname{cocl} Z_{j}
$$

where $\mathrm{j}=\mathrm{k} \mathrm{i} \mathrm{I}$, the constraint correspondence, $\mathrm{C}_{\mathrm{k}}: V$ ! $\mathrm{V}_{\mathrm{k}}$, de- ned by

$$
C_{k}(, ; x ; y ; \underline{o})=V_{k}
$$

and the preference correspondence, $\mathrm{Q}_{\mathrm{k}}: \mathrm{V}!\mathrm{V}_{\mathrm{k}}$, de- ned by

$$
Q_{k}(; ; x ; y ; \underline{o})=f y_{j}^{0} 2 Z_{j} j^{\circ}{ }_{j} \mathbb{C}\left(y_{j}^{0} i y_{j}\right)>0 g \backslash V_{k}:
$$

Clearly, $\mathrm{V}_{\mathrm{k}}$ is compact and convex, $\mathrm{C}_{\mathrm{k}}$ is continuous and $\mathrm{gr} \mathrm{Q}_{\mathrm{k}}$ is open with $y_{j} \geq \operatorname{co} Q_{k}\left(, ; x ; y ;{ }^{\circ}\right)$ for $j=k i l$.
$\backslash$ Shareholders" For agent k $2 \mathrm{fl}+\mathrm{J}+1 ;::: ; 1+2 \mathrm{~J} \mathrm{~g}$, the strategy set, $V_{k} 1 / 2 R^{S+1}$, is de- ned by

$$
V_{k}=\Phi_{+}^{s}
$$

the constraint correspondence, $\mathrm{C}_{\mathrm{k}}: \mathrm{V}$ ! $\mathrm{V}_{\mathrm{k}}$, is de ned by

$$
\mathrm{C}_{\mathrm{k}}\left(\mathrm{~g}_{0} ; \mathrm{x} ; \mathrm{y} ; \mathrm{o}^{\circ}\right)=\mathrm{f}{ }_{\mathrm{j}}^{0} 2 \mathrm{~V}_{\mathrm{k}} \mathrm{j}_{\mathrm{j}}^{\circ} 0 \mathrm{hY} \mathrm{iQi}^{?} \mathrm{~g}
$$

where $\mathrm{j}=\mathrm{k} \mathrm{i} \mathrm{I} \mathrm{i} \mathrm{J}$. Let the correspondence $F_{\mathrm{i}}: \mathrm{V}_{\mathrm{i}} £ \mathrm{~V}_{\mathrm{k}}$ ! $\mathrm{V}_{\mathrm{k}}$ where i 2 f 1;:::; I g be de ned by
where $j=k i l i J$ and let the correspondence $G_{j}: Q_{i=1} V_{i} £ V_{k} £ V_{k}$ ! f $1 ;::: ;$ I $g$ be de ned by

Then the preference correspondence, $\mathrm{Q}_{\mathrm{k}}: \mathrm{V}!\mathrm{V}_{\mathrm{k}}$, is de ${ }^{-}$ned by
where $j=k_{i}$ li $J$ and ${ }_{i}: V_{0} £{ }_{i=1}^{Q_{i=1}} V_{i} £{ }_{j=1}^{Q_{j}} Z_{j}!R^{J}$ is de- ned by

$$
{ }_{i}\left({ }_{s} ; x ; y\right)=\operatorname{argmin} k x_{i} i!_{i} i Q^{ \pm} i(Y ; Q)^{\prime} i k ; \text { s.t. }{ }_{i} 2 R^{J}:
$$

Clearly, $\mathrm{V}_{\mathrm{k}}$ is compact and convex and $\mathrm{C}_{\mathrm{k}}$ is continuous. Lemma 1 below
 $j=k i l i J$.

Lemma 1 The preference correspondence for shareholders, $\mathrm{Q}_{\mathrm{k}}$ : V! $\mathrm{V}_{\mathrm{k}}$ where $\mathrm{k} 2 \mathrm{fI}+\mathrm{J}+1 ;::: ; \mathrm{l}+2 \mathrm{Jg}$, has the following properties
${ }^{2}$ gr $Q_{k}$ is open, and,

$$
{ }^{2} \underline{\rho}_{j} \approx \infty\left(Q_{k}(; ; x ; y ; \underline{0}) \backslash C_{k}(0 ; x ; y ; \underline{0})\right) \text { for } k=1+J+j \text {. }
$$

Proof: $\backslash \mathrm{gr} \mathrm{Q}_{k}$ is open" Suppose that $\left(\mathrm{x}_{\mathrm{i}}(\mathrm{n})\right)_{\text {t2N }} 2 \mathrm{~V}_{\mathrm{i}}$ converges to $\mathrm{x}_{\mathrm{i}} 2 \mathrm{~V}_{\mathrm{i}}$ and that $\left({ }^{1} i\left(x_{i}(n)\right)\right)_{\text {t2N }} 2 \Phi_{+}^{S}$ converges to ${ }^{1}{ }_{i} \sigma{ }^{1}{ }_{i}\left(x_{i}\right) 2 \Phi_{+}^{S}$. Then there exists $x_{i}^{0} 2 P_{i}\left(x_{i}\right)$ such that ${ }^{1} \phi\left(x_{i}^{0} i x_{i}\right) \cdot 0$ so there exists $x_{i}^{\infty} 2 P_{i}\left(x_{i}\right)$ such that ${ }_{i} \phi\left(x_{i}^{\omega_{i}} x_{i}\right)<0$. Therefore there exists $N 2 N$ such that if $n, N$ then $\check{o}_{i}\left(x_{i}(n)\right) \mathbb{C}\left(x_{i}^{\infty} i x_{i}(n)\right)<0$ and $x_{i}^{\infty} 2 P_{i}\left(x_{i}(n)\right)$ according to (a.3). This is a contradiction thus ${ }_{i}: V_{i}!\Phi_{+}^{S}$ is continuous. Clearly, if ${ }_{1}: V_{i}!\Phi_{+}^{S}$ is continuous for all $i$ then gr $Q_{k}$ is open due to the de nition of $Q_{k}: V!V_{k}$.
 de $_{P}^{-}$ned by $[r] \cdot r<[r]+1$ for all $r 2 R$ and let $L_{m}={ }_{i}{ }_{i}\left[{ }^{\prime} i j(; ; x ; y)^{+} m\right]$. $m^{P}{ }_{i}{ }^{i j}\left({ }_{0} ; x ; y\right)^{+}$arti ${ }^{-}$cial consumers be de ${ }^{-}$ned by

$$
T_{1}=U_{i}\left({ }_{i j} ; x_{i}\right)
$$

 provided that $\mathrm{m}^{\prime}{ }_{\mathrm{ij}}(\mathrm{f} ; \mathrm{x} ; \mathrm{y})$, 1 . Let $\mathrm{t}_{\mathrm{j}}: \mathbb{C}_{+}^{s}!\mathrm{f} 1 ;::: ; \mathrm{L}_{\mathrm{m}} \mathrm{g}$ be de ${ }^{-}$ned by

$$
\mathrm{t}_{\mathrm{j}}\left(\mathrm{o}_{\mathrm{j}}\right)=\mathrm{fl} 2 \mathrm{f} 1 ;::: ; \mathrm{L}_{\mathrm{m}} \mathrm{gj}^{\prime} \mathrm{ij}_{\mathrm{j}}(\mathrm{o} ; \mathrm{x} ; \mathrm{y})^{+}>0 \text { and } \mathrm{o}_{\mathrm{j}}^{0} 2 \mathrm{~T}_{\mathrm{l}} \mathrm{~g}
$$

and let $R_{j} 1 / 2 \varphi_{+}^{S}$ be de ned by

If ${ }_{j}^{0} 02 \mathrm{Q}_{\mathrm{k}}(0 ; \mathrm{x} ; \mathrm{y} ; \stackrel{\circ}{\circ})$ then there exists " $>0$ such that
due to the de nition of $Q_{k}: V!V_{k}$. Therefore, ${ }_{j} 02 R_{j}$ provided that $m>I=\left({ }^{\prime} P_{i}{ }^{\prime}(, ; x ; y)^{+}\right)$so $Q_{k}(; ; x ; y ; \underline{O}) \frac{1 / 2}{}\left[m R_{j}\right.$.

Clearly, $\varrho_{j} \underset{j}{\mathcal{Z}} \operatorname{Co}\left(\mathrm{~F}_{\mathrm{i}}\left({ }^{\circ}{ }_{\mathrm{i}} ; \mathrm{x}_{\mathrm{i}}\right) \backslash \mathrm{C}_{\mathrm{k}}\left(\mathrm{g} ; \mathrm{x} ; \mathrm{y} ;{ }^{\mathrm{o}}\right)\right)$ due to the construction of
 cause $\operatorname{dim} \mathrm{C}_{\mathrm{k}}\left(\mathrm{s} ; \mathrm{x} ; \mathrm{y} ;{ }^{\circ}\right)=\mathrm{S} ; \mathrm{J}$ and $1 / 2 . \quad(\mathrm{S} ; \mathrm{J})=(\mathrm{S} ; \mathrm{J}+1)$ hence

Q.E.D.

Step 2: construction of correspondence and existence of ${ }^{-}$xed point
Let $K=f 0 ;::: ; 1+2 J g$ then $V_{k}$ is compact and convex for all k 2 K and $V={ }_{k 2 k} V_{k}$. Let the map $f_{k}: V £ V_{k}!R_{+}$be de- ned by

$$
f_{k}\left(z ; z_{k}^{0}\right)=\min _{\left(v ; v_{k}^{0}\right) 2\left(g r Q_{k}\right)^{c}} k\left(z ; z_{k}^{0}\right) i \quad\left(v ; v_{k}^{0}\right) k ;
$$

the correspondence $\mathrm{g}_{\mathrm{k}}: \mathrm{V}!\mathrm{V}_{\mathrm{k}}$ by

$$
g_{k}(z)=\arg \max _{z_{k}^{2} 2 C_{k}(z)} f_{k}\left(z ; z_{k}^{0}\right):
$$

Then the correspondence, $h: V!V$ de $n$ ned by $h_{k}(z)=c o g_{k}(z)$ is upper hemi-continuous and compact and convex valued. Therefore there exists
 Kakutani ${ }^{-}$xed point theorem. Hence, $z_{k}^{\text {a }} 2 C_{k}\left(z^{a}\right)$ and $Q_{k}\left(z^{\text {a }}\right) \backslash C_{k}\left(z^{\text {a }}\right)=$; because $z_{k} \underset{z}{z} \operatorname{co} Q_{k}(z) \backslash C_{k}(z)$.

Step 3: existence of $1 / 2$ majority stable equilibrium
For consumers, there exists $x_{i}\left(f!{ }_{i} g+{ }^{P}{ }_{j} \ddagger_{j} \operatorname{cocl} Z_{j}\right) 2 R^{s+1}$ such that if $x_{i} 2 B_{i}(Q ; Y)$ and $P_{i}\left(x_{i}\right) \backslash B_{i}(Q ; Y)=$; then $x_{i}, ~ x_{i}\left(f!{ }_{i} g+{ }_{j}{ }_{j} \dagger_{j j} c o c l Z_{j}\right)$ according to (a.6) becausef! ${ }_{i} g+{ }_{j}{ }_{\mathrm{t} j} \mathrm{cocl} Z_{j}$ is compact according to (a.7). Therefore there exist $z^{\text {a }} 2 h\left(z^{\text {a }}\right)$ and $N_{C} 2 N$ such that if $n, ~ N_{C}$ - recall that
 and co $P_{i}\left(x_{i}^{\text {a }}\right) \backslash B_{i}\left(Q^{\text {a }} ; Y^{\text {a }}\right)=$; thus $x_{i}^{\text {a }}=!_{i}+Q^{\text {a }}{ }^{+}+\left(Y^{\text {a }} i Q^{\text {a }}\right) \mu_{i}^{\text {d }}$ for some $\mu_{\mathrm{i}}^{\mathrm{a}} 2[0 ; 1]^{\mathrm{J}}$.

For consumers, if ${ }_{s}(n)!$, where ${ }_{s}{ }^{s}(n), \quad 1=n$ and ${ }_{s}^{s}=0$ for s $2 S^{01 / 2}$ $S$ and $x_{1}(n) 2 C_{1}\left(,(n) ; x(n) ; y(n) ;{ }_{p}(n)\right)$ and $Q_{1}(0(n) ; x(n) ; y(n) ; \underline{0}(n)) \backslash$ $\mathrm{C}_{1}\left(\mathrm{~g}(\mathrm{n}) ; \mathrm{x}(\mathrm{n}) ; \mathrm{y}(\mathrm{n}) ;{ }^{\circ}(\mathrm{n})\right)=$; then $\mathrm{s}^{2} \mathrm{so}_{1}^{\mathrm{S}}(\mathrm{n})$ ! 1 according to (a.3) and (a.4) while consumption is bounded from below for all consumers according to (a.6). Therefore, for the auctioneer, there exists $\mathrm{N}_{\mathrm{A}} 2 \mathrm{~N}$ such that if $\mathrm{n}_{\mathrm{P}}, \mathrm{N}_{\mathrm{A}}$ - recall that $\mathrm{V}_{\mathrm{K}}=\Phi_{+}^{\mathrm{S}} \backslash[1=\mathrm{n} ; 1]^{\mathrm{S}+1}$ for $\mathrm{k}=0$ - and $\mathrm{z}^{\mathrm{D}} 2 \mathrm{~h}\left(\mathrm{z}^{\mathrm{P}}\right)$ then ${ }_{i} x_{i}^{d}={ }_{i}!_{i}+{ }_{j} y_{j}^{\mathrm{D}}$.
For the ${ }^{-} r m s$, if $z^{a} 2 h\left(z^{a}\right)$ then $y_{j}^{a} 2 \operatorname{argmax}{ }^{0}{ }_{j}^{\text {p }} y_{j}$; s.t. $y_{j} 2 \mathrm{cocl} Z_{j}$

Lemma 2 If $z^{\mathrm{a}} 2 \mathrm{~h}\left(z^{\mathrm{a}}\right)$ and $\mathrm{n}, \mathrm{N}_{\mathrm{C}}$ then $\mathrm{P}_{\mathrm{j}}^{1 / 2}\left(\mathrm{x}^{\mathrm{a}} ; \mu_{\mathrm{j}}^{\mathrm{a}} ; \mathrm{y}_{\mathrm{j}}^{\mathrm{a}}\right)=;$.
Proof: Suppose that $n, ~ N_{C}$, if $x_{i}^{a}+\left(y_{j} i y_{j}^{a}\right) \mu_{i j}^{a} 2 P_{i}\left(x_{i}^{a}\right)$ and $\mu_{i j}^{a}>0$ then ${ }^{1}{ }_{i}\left(x_{i}^{\mathrm{D}}\right) \Phi\left(\mathrm{y}_{\mathrm{j}} \mathrm{i} \mathrm{y}_{\mathrm{j}}^{\mathrm{D}}\right)>0$ and if ${ }^{1}{ }_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}^{\mathrm{a}}\right) \Phi\left(\mathrm{y}_{\mathrm{j}} \mathrm{i} \mathrm{y}_{\mathrm{j}}^{\mathrm{D}}\right) 60$ and $\mu_{\mathrm{j}}>0$ then $x_{i}^{\text {a }}+\left(y_{j} i y_{j}^{\text {a }}\right) \geq P_{i}\left(x_{i}^{\text {a }}\right)$. Hence, if

$$
\frac{P^{i}{ }_{i p H} H_{i}\left(v_{i}\right) \mu_{j}^{n_{j}^{+}}}{i \mu_{i j}^{+}} \cdot 1 / 2
$$

for all $v_{j} 2 h_{j}{ }_{j}{ }^{?}$ ? where
then $P_{j}^{1 / 2}\left(x^{\mathrm{p}} ; \mu_{j}^{\mathrm{a}} ; y_{j}^{\mathrm{a}}\right)=$; because $Y_{j}^{1 / 2} f y_{j}^{\mathrm{a}} \mathrm{g}+\mathrm{h}_{\mathrm{j}}^{\mathrm{p}}{ }_{\mathrm{j}}$ ? $; R_{+}^{\mathrm{S}+1}$. Thus, $\mathrm{h}_{\mathrm{j}} \mathrm{i}^{\text {? }}$ separates $H_{j}\left(v_{j}\right)$ from the rest of the $i$ 's in the sense that $H_{j}\left(v_{j}\right)$ is above $\mathrm{hv}_{\mathrm{j}} \mathrm{i}^{\text {? }}$ while the rest of the i 's are below or on $\mathrm{hv}_{\mathrm{j}} \mathrm{i}^{\text {? }}$, i.e. i $2 \mathrm{H}_{\mathrm{j}}\left(\mathrm{v}_{\mathrm{j}}\right)$ if and only if ${ }^{1}{ }_{i}\left(x_{i}^{\text {P }}\right) ~ ¢ v_{j}>0$.

For $v_{j} 2 h_{j}{ }_{j}{ }^{\mathrm{a}}$ ? suppose that ${ }^{P}{ }_{s} v_{j}^{s}<1$ without loss of generality and let $(p(n))_{n 2 N} 2 \Phi$ where $\Phi=f, 2 R^{S+1} j^{P}{ }_{s,}{ }^{s}=1 \mathrm{~g}$ be de ${ }^{-}$ned by

$$
p(n)=\frac{1}{n+{ }_{s} v_{j}^{s}}\left(n_{j}^{o^{n}}+v_{j}\right):
$$

for all $n$ then $(p(n))_{n 2 N}$ converges to ${ }_{j}^{o{ }_{j}}$. Let $(q(n))_{n 2 N} 2 h p(n)+{ }_{j}{ }_{j}{ }_{j}$ ? be de- ned by
for all $n$. Then some tedious calculations show that $(n q(n))_{n 2 N}$ converges to $v_{j}$ and $h q(n) i^{\text {? }}$ separates $G_{j}\left({ }^{\circ}{ }_{j} ; x^{n} ; p(n)\right)$ from the rest of the $i^{\prime} s$ in the sense that $G_{j}\left({ }^{(0}{ }_{j} ; x^{\mathrm{a}} ; p(n)\right)$ is above $\mathrm{hq}(\mathrm{n}) \mathrm{i}^{\text {? }}$ while the rest of the i 's are below or on $h q(n) i^{\text {? }}$. Moreover there exists N 2 N such that if n , N then $\mathrm{hw}_{\mathrm{j}} \mathrm{i}^{\text {? }}$ separates $\mathrm{G}_{\mathrm{j}}\left({ }^{0}{ }_{j}{ }^{\mathrm{p}} ; \mathrm{x}^{\mathrm{n}} ; \mathrm{p}(\mathrm{n})\right)$ from the rest of the i 's in the sense that $G_{j}\left({ }^{o}{ }_{j} ; x^{\mathrm{a}} ; p(n)\right)$ is above $\mathrm{h}_{\mathrm{j}} \mathrm{i}^{\text {? }}$, while the rest of the i 's are below or on $h \mathrm{w}_{\mathrm{j}} \mathrm{I}^{\text {? }}$. Thus if $n, N$ then $G_{j}\left(\underline{o}_{j}{ }_{j} ; x^{\mathrm{a}} ; p(n)\right)=H_{j}\left(v_{j}\right)$. Therefore, $P_{j}^{1 / 2}\left(x^{\mathrm{a}} ; \mu_{j}^{\mathrm{a}} ; y_{j}^{\mathrm{a}}\right)=$; because $Q_{I+J+j}\left(z^{\text {® }}\right)=$;
Q.E.D.

For shareholders, if $z^{\mathrm{a}} 2 h_{1+J+j}\left(z^{\mathrm{a}}\right)$ then $P_{j}^{1 / 2}\left(x^{\mathrm{a}} ; \mu_{j}^{\mathrm{a}} ; y_{j}^{\mathrm{a}}\right)=$; provided that $n, N_{C}$ according to lemma 2. Thus, if $1 / 2,(S ; J)=(S ; J+1)$ and $n, \operatorname{maxf} N_{A} ; N_{C} g$ then a $1 / 2 m$ majority stable equilibrium exists.

Part 2: $1 / 2, \quad B=(B+1)$
The variables to be determined are state prices, $2 \Phi_{+}^{S}$, consumption bundles for consumers, $x=\left(x_{i}\right)_{i=1}^{!} 1^{1 / 2} Q_{i=1} X_{i}$, and production plans for ${ }^{-} r m s$, $y=\left(y_{j}\right)_{j=1}^{J}{ }^{1 / 2}{ }^{Q_{j=1}} Y_{j}$.

Let strategy sets, constraint correspondences and preference correspondences be de- ned as in part 1 of the proof for $\mathrm{k} 2 \mathrm{f} 0 ; 1 ;::: ; \mathrm{l}$ g.
$\backslash$ Firms" For agent k $2 \mathrm{fI}+1 ;::: ; \mathrm{l}+\mathrm{Jg}$, the strategy set, $\mathrm{V}_{\mathrm{k}} 1 / 2 \mathrm{R}^{\mathrm{S}+1}$, is de- ned by

$$
\mathrm{V}_{\mathrm{k}}=\mathrm{cocl} \mathrm{Z}_{\mathrm{j}}
$$

where $\mathrm{j}=\mathrm{ki} \mathrm{I}$, the constraint correspondence, $\mathrm{C}_{\mathrm{k}}: V!\mathrm{V}_{\mathrm{k}}$, is de- ned by

$$
C_{k}(; ; x ; y ;)=V_{k}
$$

and the preference correspondence, $Q_{k}: V!V_{k}$, is de ${ }^{-}$ned by

$$
Q_{k}(; ; x ; y)=P_{j}^{1 / 2}\left(x ;_{j}^{\prime}(, ; x ; y) ; y_{j}\right) \backslash V_{k}:
$$

Clearly, $\mathrm{V}_{\mathrm{k}}$ is compact and convex, $\mathrm{C}_{\mathrm{k}}$ is continuous and $\mathrm{gr} \mathrm{Q}_{\mathrm{k}}$ is open with $y_{j} \underset{\sim}{2} \operatorname{co} \mathrm{Q}_{\mathrm{k}}(, ; \mathrm{x} ; \mathrm{y})$ for $\mathrm{j}=\mathrm{ki} \mathrm{l}$ according to the proof of theorem 2 in Greenberg (1979).

The rest of the proof follows from part 1 . Thus, if $1 / 2, B=(B+1)$ then a $1 / 2 m$ majority stable equilibrium exists.

Part 3: an example showing that the bound is binding
Consider an economy with S consumers with utility functions linear in period zero consumption and log-linear in period 1 consumption. Consumer i is indexed by weights, $1 / 4=(1 / 8)_{s=1}^{S}$ with ${ }^{P} S_{s=1} 1 / \$=1$, on consumption in di®erent states. The utility function of consumer i is:

$$
u_{i}\left(x_{i}\right)=x_{i}^{0}+{ }_{s=1}^{x^{S}} 1 / 8 \log x_{i}^{s} \quad \text { with } \quad \begin{align*}
& 8  \tag{1}\\
& <1 / 4=" \\
& : 1 / 4=1 i
\end{align*} \text { if } \quad s \in i
$$

where " 2$] 0 ; 1 ; 1=(S ; 1)$ [ is small. Although these utility functions do not satisfy assumption (a.6), since the argument is local they can be easily extended outside the relevant domain to ful ${ }^{-}$Il this assumption. All consumers are endowed with identical initial shares of the $J{ }^{-} r m s: \ddagger_{j}=1=S$, for all $i ; j$, and the same vector of initial resources: $!_{i}=(!; 0 ;::: ; 0)$, all $i$.

All $\mathrm{J}^{-}$rms have their sets of e $\pm$cient production plans included in the same ( $S$; 1)-dimensional linear subspace:

$$
Y=y=\left(y^{0} ; y^{1} ; y^{2} ;::: ; y^{s}\right) 2 R^{s} j_{s=0}^{X^{s}} y^{s}=0 \text { and } y^{0}=i 1^{\prime} \quad:
$$

De- ne the production plans $y=\left(y_{j}\right)_{j=1}^{J}$ by:

$$
\mathrm{y}_{\mathrm{j}}^{\mathrm{s}}=\begin{array}{ccc}
8 & \text { for } \mathrm{s}=0 \\
\gtreqless & 1 & \text { for } \mathrm{s}=\mathrm{j} \\
3 & 0 & \text { otherwise }
\end{array}
$$

for j • J ; 1 and for ${ }^{-r m}$ J

$$
y_{J}^{s}=\begin{array}{ccl}
8 & i 1 & \text { for } s=0 \\
\gtrless & 1=(S i J+1) & \text { for s } 2 \mathrm{f} J ;::: ; \mathrm{Sg} \\
3 & 0 & \text { otherwise }
\end{array}
$$

Next, de ${ }^{-}$ne $y^{\prime}=\left(y_{j}\right)_{j=1}^{J}$ such that $y_{j}=y_{J}$ and $y_{j}=B_{j}+(1 ; B) y_{j}$ for $j$. $J i 1$, with $®=J=S$. Let, for all $j, Z_{j}=Y \backslash B\left(y_{j} ; \underline{\circ}\right)$ where $B\left(y_{j} ; \underline{o}\right)$ stands for the ball with center yj and radius ${ }^{\circ}$. This way, an ( $" ; \underline{\circ}$ )-economy is de- ned.
 does not have a $1 / 2 m$ majority stable equilibrium for $1 / 2<(S ; J)=(S ; J+1) i^{\prime}$.

Consider the (";0)-economy. It is now shown that there is a unique $1 / 2$ majority stable equilibrium (for all $1 / 2$ since ${ }^{0}=0$ implies there is no alternative production plan), ( $\left.q^{\mathrm{a}} ; \mu^{\mathrm{a}} ; \mathrm{y}^{\mathrm{a}}\right)$, with $\mathrm{y}^{\mathrm{a}}=\mathrm{y}^{\downarrow}$ and $\mathrm{q}^{\mathrm{a}}=^{-} 1_{\mathrm{J}}$ where ${ }^{-}=S=J ; 1$.

For the announced production plans $y^{\text {a }}$, the expression of the utility level of agent $i$ buying, at price $q^{\text {a }}$, the portfolio $\left(\mu_{i j}\right)_{j=1}^{J}$ is:

First-order conditions of this maximization problem (optimal portfolio choice) gives:

which in turn yields:

It is easily checked that stock markets clear, as well as markets for good, for the chosen values of $®=J=S$ and under the equilibrium price ${ }^{-}=S=J ; 1$. Then the equilibrium portfolio is:

$$
8 \mathrm{~s} \cdot \mathrm{~J} ; 1: \mu_{\mathrm{is}}^{\mathrm{a}}=1 / 4 ; \text { and } \mu_{\mathrm{i}}^{\mathrm{a}}=\frac{\mathrm{J}}{\mathrm{~S}} \mathrm{~S}^{1 / 4} ;\left(1 ; \frac{\mathrm{J}}{\mathrm{~S}}\right)^{1 / 4} ;
$$

which is such that ${ }_{j=1}^{X} \mu_{i j}^{a}=\frac{J}{S}$ for all i.
Suppose now that ${ }^{-} r m \mathrm{~J}$ is given the opportunity to propose a small change of its production plan. For " small enough, one has $\mu_{\mathrm{i} j}^{\mathrm{j}}>0$ for $\mathrm{J} \cdot \mathrm{i} \cdot \mathrm{S}$ and $\mu_{\mathrm{J}}^{\mathrm{a}}<0$ for $0 \cdot \mathrm{i} \cdot \mathrm{J} \mathrm{i} 1$. Hence, only the S ; $\mathrm{J}+1$ last consumers have a positive quantity of shares in ${ }^{-} r m \mathrm{~J}$ and consequently they are the only ones to vote, with the same voting weights. The utility function of consumer i, J • i • S, has been constructed such that, at this symmetric equilibrium, consumer i supports a (technically possible) change from $y_{J}$ to $y_{j}^{0}$ in $Z_{J}$ if and only if $y_{j}^{i} \cdot y_{j}^{0}$, i.e. any change that yields more in state i. For example, $y_{J}^{0}=y_{J}+\left(0 ;::: ; 0 ; i^{\prime \prime ;}=(\mathrm{S} ; \mathrm{J}) ;::: ; "=(\mathrm{S} ; \mathrm{J})\right)$ gets the support of the last $S_{i} J$ shareholders/ shares. Hence, $\left(q^{q} ; \mu^{q} ; y^{q}\right)$ is not stable for any super majority rule of size smaller than ( $\mathrm{S} ; \mathrm{J})=(\mathrm{S} ; \mathrm{J}+1$ ). Subject to the obvious upper hemi-continuity of the equilibrium correspondence in the present setup, any $1 / 2 m$ majority stable equilibrium of the ("; $\because$ )-economy, for " and ${ }^{\circ}$ small enough, is such that $1 / 2>(S ; J)=(S ; J+1) i^{\prime}$. Finally, note that $S ; J \cdot B=S ; 1$ so there is no ned to consider the other case which is more obvious.

## Proof of Corollary 1

The variables to be determined are prices, p $2 \Phi_{+}^{J}$, consumption bundles for consumers, $x=\left(x_{i}\right)_{i=1}^{1} 1^{1 / 2} Q_{i=1} X_{i}$, and production plans for ${ }^{-}$rms, $y=$ $\left(y_{j}\right)_{j=1}^{J} 1 / 2 Q_{j=1} Y_{j}$.
$\backslash$ Auctioner" For agent $k=0$, the strategy set, $V_{k} 1 / 2 R^{J+1}$, is de- ned by

$$
V_{k}=\Phi_{+}^{J} \backslash\left[\frac{1}{n} ; 1\right]^{J+1}
$$

where n 2 N , the constraint correspondence, $\mathrm{C}_{\mathrm{k}}: \mathrm{V}$ ! $\mathrm{V}_{\mathrm{k}}$, is de ned by

$$
C_{k}(p ; x ; y)=V_{k}
$$

and the preference correspondence, $\mathrm{Q}_{\mathrm{k}}: \mathrm{V}!\mathrm{V}_{\mathrm{k}}$, is de ${ }^{-}$ned by

$$
\begin{aligned}
Q_{k}(p ; x ; y)= & f p^{0} 2 V_{k j}\left(p_{0}^{0} i p_{0}\right)\left({ }_{i}^{x} x_{i}^{0}{ }_{i}^{x} \sum_{i}{ }_{i}^{0}{ }_{i}^{x} y_{j}^{0}\right) \\
& +{ }_{j}^{x}\left(p_{j}^{0} i p_{j}\right)\left({ }_{i}^{x}{ }_{i j}(p ; x ; y) ; 1\right)>0 g:
\end{aligned}
$$

where $q=p_{j}=p_{0}$ for all $j$ and ${ }_{i}: V_{0} £{ }^{Q_{i=1}} V_{i} £{ }^{Q_{j=1}} Z_{j}!\quad[0 ; 1]^{J}$ is de ned by

$$
{ }_{i}(p ; x ; y)=\operatorname{argmin} k x_{i} i!_{i} i \quad Q_{A} i \quad(Y ; Q)^{\prime}{ }_{i} k ; \text { s.t. }{ }_{i} 2[0 ; 1]^{J}
$$

for all i. Clearly, $V_{k}$ is compact and convex, $C_{k}$ is continuous and $\operatorname{gr} Q_{k}$ is open with $p \notin$ co $Q_{k}(p ; x ; y)$.
\Consumers" Asin part 1 in the proof of theorem 1 - restricting portfolios to $[0 ; 1]^{\mathrm{J}}$ and disregarding ${ }^{\circ}$.
\Firms" As in part 2 in the proof of theorem 1 - restricting portfolios to $[0 ; 1]^{J}$ in the de nition of $P_{j}^{1 / 2}\left(x ; \mu_{j} ; y_{j}\right)$, replacing $\mu_{j}$ with ${ }^{\prime}(p ; x ; y)$ and disregarding ${ }^{\circ}$.

The rest of the proof follows from the last part of part 1 in the proof theorem 1.

## Proof of Corollary 3

Proof: Follows from the proof of Theorem 1 with minor changes provided that $x_{i} 2 B_{i}(Q ; Y)$ and $P_{i}\left(x_{i}\right) \backslash B_{i}(Q ; Y)$ imply that $y_{j} \in \operatorname{co~} \mho_{i j}\left(q ; x_{i} ; y_{j}\right)$.

Hence, suppose that $\left(y_{j}(n)\right)_{n=1}^{N} 2 \vartheta_{i j}\left(q ; x_{i} ; y\right)$ where $N 2 N$ then there exists $\left(\mu_{i}(n)\right)_{n=1}^{N}$ such that $x_{i} \underset{P}{+}\left(Y j y_{j}(n) i Q\right) \mu_{i}(n) 2 P_{i}\left(x_{i}\right)$ for all $n 2$ $f 1 ;::: ; n$. Suppose that $y_{j}^{0}={ }^{P}{ }_{n} B(n) y_{j}(n)$ where $®(n), 0$ for all $n$ and
$P_{n} B(n)=1$ and let $\mu_{j}^{0}$ and $\left(^{-}(n)\right)_{n=1}^{N}$ where ${ }^{-}(n), \quad 0$ for all $n$ and ${ }^{P}{ }_{n}{ }^{-}(n)=$ 1 be de ned by $®(n) \mu_{i j}^{0}=^{-}(n) \mu_{i j}(n)$ for all $n$ and $\mu_{i j 0}^{0}={ }^{-}{ }^{-}(n) \mu_{i j} o(n)$ for all $j^{0} 6 j$. Then

$$
x_{i}+\left(Y j y_{j}^{0} ; Q\right) \mu_{i}^{0}=X_{n=1}^{N}-(n)\left(x_{i}+\left(Y j y_{j}(n) i Q\right) \mu_{i}(n)\right):
$$

Therefore, if $x_{i} 2 B_{i}(Q ; Y)$ and $P_{i}\left(x_{i}\right) \backslash B_{i}(Q ; Y)$ then $y_{j} \underset{\operatorname{Lr}}{ } \operatorname{co} \mathrm{U}_{\mathrm{ij}}\left(\mathrm{q} ; \mathrm{x}_{\mathrm{i}} ; \mathrm{y}_{\mathrm{j}}\right)$.
It is necessary to bound portfolios to be non-negative in order to ensure that there exists $\mu_{i}^{0}$ and $\left({ }^{-}(n)\right)_{n}$ such that $\left(Y j y_{j}^{0}{ }_{i} Q\right) \mu_{i}^{0}={ }^{P}{ }_{n}{ }^{-}(n)\left(Y j y_{j}(n) i\right.$ Q) $\mu_{i}(n)$.
